What is Project Overload?

Project Overload is a conversational AI platform that lets anyone — from executives to analysts — define, run, and automate business intelligence reports using plain English. No SQL skills needed. No dashboard configuration. Just talk to it.

"Define once, run forever. Report contracts lock your business logic and execute on your schedule."

RUNS

The Problem We Solve

The BI Gap

Business users need analytics but lack SQL skills. Existing BI tools require complex manual setup, query writing, and ongoing maintenance by technical teams.

Report Fatigue

Recurring reports are rebuilt manually every cycle. Inconsistent formatting, missed deadlines, and lost institutional knowledge make reporting a drag.

Insight Blindness

Raw data gets delivered without context. Reports show numbers but miss the "so what" — the trends, drivers, and recommended actions that drive decisions.

Governance Gaps

Ad-hoc queries bypass security controls. No audit trail, no table restrictions, no guarantee that the same report produces the same logic twice.

Who Is This For?

Project Overload bridges the gap between data teams and business stakeholders, serving everyone who needs insights from databases.

C-Suite Executives

CEOs, CFOs, and VPs who need weekly or monthly performance summaries without waiting for the data team. They speak in business language — revenue trends, churn rates, conversion funnels — and want PDF reports delivered automatically.

- **Pain:** Waiting days for reports that should take minutes
- **Win:** Automated, executive-formatted reports on their schedule

Data Analysts & Operations

Analysts who spend hours rebuilding the same reports. They know their data but want to automate the repetitive work and focus on higher-value analysis.

- **Pain:** 60% of time spent on recurring report mechanics
- **Win:** Define once, let the system handle scheduling and formatting

Department Heads & Team Leads

Managers who need team-level metrics (support ticket volume, sales pipeline, marketing ROI) but don't have direct database access or SQL fluency.

- **Pain:** Dependent on engineering for every data request
- **Win:** Self-serve analytics through natural conversation

Data Engineers & Platform Teams

Technical teams who want to enable self-serve analytics while maintaining governance. They configure connections, set allowlists, and define guardrails.

- **Pain:** Fielding one-off data requests all day
- **Win:** Empower stakeholders with governed, auditable self-service

The AI Report Pipeline

From natural language to executive-ready PDF, powered by a multi-stage AI pipeline. Each stage is purpose-built for maximum accuracy and insight quality.

1. Conversational Scoping

Users describe what they need in plain English. The AI asks clarifying questions over 5–15 turns to nail down: report name, audience, metrics, filters, schedule, and timezone. A scope confirmation step ensures alignment before any queries run.

2. Query Strategy

The Query Strategist AI generates 2–4 targeted SQL queries from the conversation context and database catalog. Each query is validated against table allowlists and security guardrails before execution.

3. Per-Question Analysis

Each query result is analyzed independently by the AI Analyst, which identifies trends, anomalies, and insights. A 90% confidence threshold ensures only

4. Report Composition

All analyses are synthesized into a rich HTML report structured as an executive brief: **What Changed, Why** (drivers), **So**

high-quality findings make it into the final report.

What (implications), **What To Do** (actions), plus an evidence appendix.

Evidence-Based, Not Hallucinated

Every finding in a report is backed by actual query results (up to 200 evidence rows). Query hashes and freshness metadata ensure full reproducibility and audit trail. The system never guesses — it shows its work.

Feature Deep Dive

Everything a business needs to go from question to automated insight delivery.

CORE FEATURE

Chat Explorer

The primary interface. Users have a multi-turn conversation with the AI to define exactly what report they need. The system guides the conversation, asking about audience, metrics, filters, and delivery preferences.

- Multi-turn conversational flow (5–15 messages typical)
- Scope confirmation step before execution
- Real-time evidence tables with live data preview
- Follow-up questions on completed reports
- Business case generation from findings

CORE FEATURE

Dual Insight Modes

Toggle between two analysis perspectives on the same data to get exactly the insights you need:

Business Insights

Trends, growth drivers, competitive signals, actionable recommendations, and strategic implications. The "so what" for executives.

Data Quality

Completeness gaps, anomalies, outliers, inconsistencies, and data freshness issues. The "how reliable" for analysts.

CORE FEATURE

Report Contracts

The heart of the platform. A Report Contract is a locked, reusable template that captures your business logic:

- **Name & Audience:** Who this report serves
- **SQL Templates:** Locked queries that produce consistent results
- **Guardrails:** Row caps, allowed tables, security constraints
- **Schedule:** Cron-based automation (weekly, monthly, quarterly)
- **Lifecycle:** Draft → Approved → Locked → Running

CORE FEATURE

PDF Export

Every report is rendered as a polished, executive-ready PDF using Puppeteer. Download on demand or receive automatically via scheduled delivery. Reports include structured sections, evidence tables, and branded formatting.

Scheduled Reports

The newest addition to Project Overload — define a report once in conversation, then let the system run it automatically on a recurring schedule.

NEW FEATURE

Set It and Forget It

After building a report through chat, users can lock it into a schedule profile. The system handles everything: rolling reporting windows forward, re-executing queries, running AI analysis, composing the report, and generating the PDF — all automatically.

Flexible Scheduling

- **Weekly:** e.g., every Friday at 6pm
- **Monthly:** e.g., 1st of every month
- **Quarterly:** e.g., Q1, Q2, Q3, Q4 reviews
- Full timezone support (IST, EST, UTC, etc.)
- Cron expression generation under the hood

Smart Rerun Behavior

- Per-question rerun instructions
- Automatic window rolling (last week → this week)
- Query template snapshots preserved
- Scope summary for each question
- AI-suggested rerun configurations

Run History & Monitoring

- Complete run history with timestamps
- Status indicators: Succeeded / Failed / Scheduled
- "Open in Chat" to analyze any past run
- Run count tracking and latest-run display
- Delta tracking vs. previous runs

Automation Hub UI

- Tile-based dashboard of all scheduled reports
- At-a-glance frequency, timezone, question count
- Drill into schedule details and execution plans

- Manage, pause, and reconfigure schedules
- Visual schedule draft generation flow

SCHEDULING LIFECYCLE

Connect Any Database, Securely

Project Overload connects to the databases your business already uses — with enterprise-grade security baked into every layer.

Supported Databases

 PostgreSQL

 Supabase

 Neon

 MySQL

 Snowflake

 BigQuery

Connection Workflow

Test Connection

Paste a connection string, add optional TLS/CA certificates, and validate connectivity in one click.

Discover Catalog

The system automatically discovers all tables, schemas, and relations in the connected database.

Set Allowlist

Select which tables the AI is permitted to query. Only allowlisted tables are visible to the system.

Add Business Context

Describe your industry, use case, and domain — so the AI understands your data semantically.

Activate & Query

Connection goes live. Multiple databases can be active simultaneously in a single session.

Security Guardrails

Read-Only Enforcement

No INSERT, UPDATE, DELETE, or DDL operations — ever. The SQL Guard

Table Allowlisting

Admins define exactly which tables are queryable. The AI cannot access,

package validates every query before execution.

reference, or even see non-allowlisted tables.

Row Caps & Limits

Evidence tables are capped at 200 rows per query. Prevents runaway queries, controls cost, and keeps analysis focused.

Full Audit Trail

Every contract, run, query, and approval is logged. Complete traceability from conversation to report delivery.

From Zero to Automated Report

A typical user's journey from first login to receiving automated weekly reports.

Step 1: Connect a Database

Navigate to the Connect page. Paste your PostgreSQL or Snowflake connection string. Test and activate in under a minute. Set your table allowlist and business context.

Step 2: Start a Conversation

Open Chat Explorer. Type something like: *"I need a weekly CEO dashboard showing revenue trends, top customers, and churn risk."* The AI begins asking clarifying questions.

Step 3: Refine Through Dialogue

Over 5–15 messages, narrow down: audience (CEO + board), metrics (MRR, net revenue retention, churn %), time range (trailing 4 weeks), and filters (exclude test accounts). Toggle insight mode as needed.

Step 4: Review Scope Confirmation

The AI presents a structured scope summary for your approval. Review the planned queries, target tables, and analysis approach before committing.

Step 5: Generate First Report

The pipeline runs: Query Strategist plans 2–4 SQL queries, DataPlane executes against your live database, Analyst evaluates each result, Report Composer synthesizes into a structured executive brief.

Step 6: Download or Schedule

View the rich HTML report in-app. Download as PDF. Or lock it into a schedule: "Run every Friday at 6pm IST." The system auto-generates a schedule draft with per-question rerun configurations.

Step 7: Sit Back and Receive

Reports run automatically on schedule. View run history on the Scheduled Reports dashboard. Open any past run in chat to ask follow-up questions or compare with previous periods.

Time to First Report: Minutes, Not Weeks

Traditional BI setup takes weeks of requirements gathering, dashboard building, and iteration. With Project Overload, users go from zero to their first automated report in a single conversation — typically under 15 minutes.

Settings, Metrics & Usage

Fine-tune the platform with business context, metric definitions, and real-time usage visibility.

Metric Definitions Library

Pre-define your organization's key metrics so the AI uses consistent, approved definitions across all reports.

METRIC	DEFINITION	TYPE
Monthly Recurring Revenue	Sum of all active subscriptions x monthly price	Financial
Daily Active Users	Unique users with at least one session per day	Product
Conversion Rate	Signups / Unique visitors x 100	Growth
Net Revenue Retention	Revenue from existing customers including expansion	Financial

Business Context

Provide organizational background, industry info, and domain-specific knowledge. This context is shared across all conversations and reports, ensuring the AI understands your business deeply.

Usage Dashboard

Real-time visibility into platform usage:

- LLM token consumption (input/output)
- Query execution counts
- Report generation statistics
- Cost tracking and transparency

Technology Under the Hood

Built on a modern, enterprise-ready stack designed for reliability, security, and performance.

Why Project Overload?

What sets Project Overload apart from traditional BI tools, dashboards, and other AI analytics platforms.

CAPABILITY	TRADITIONAL BI	PROJECT OVERLOAD
Report Creation	Manual SQL + drag-and-drop dashboards	Natural language conversation
Time to First Report	Days to weeks	Under 15 minutes
Analysis Quality	Numbers only — you interpret	AI-generated insights + actions
Recurring Reports	Rebuild manually or rigid schedules	Smart auto-scheduling
SQL Knowledge	Required	Zero SQL needed
Security Model	Varies widely	Read-only + allowlists + audit
Output Format	Interactive dashboards	Executive PDF + HTML + chat
Follow-Up Analysis	Start over with new query	Conversational follow-ups

Key Selling Points

Report Contracts

Lock business logic into reusable templates. Run the same report with guaranteed consistency forever — no drift, no manual intervention.

Evidence-Based AI

Every insight is backed by real data. 90% confidence threshold filters out noise. Query hashes ensure reproducibility.

Define Once, Run Forever

Governance First

From conversation to locked schedule in one session. The system auto-rolls windows, re-executes queries, and delivers fresh reports.

Read-only access, table allowlists, row caps, SQL validation, and full audit logging. Built for enterprises that care about data security.

Feature Overview

Complete map of all product surfaces, screens, and capabilities.

SCREEN	FEATURE	DESCRIPTION	STATUS
Chat Explorer	Multi-Turn AI Chat	Conversational report definition with scope confirmation	Live
Chat Explorer	Insight Mode Toggle	Switch between Business Insights and Data Quality	Live
Chat Explorer	Report Generation	Full pipeline: strategize → query → analyze → compose	Live
Chat Explorer	PDF Export	Download executive-ready PDF of any report	Live
Chat Explorer	Report Follow-Ups	Ask questions, generate business cases from findings	Live
Scheduled	Automation Hub	Tile dashboard of all scheduled report profiles	New
Scheduled	Run History	View past runs with status, timestamps, and re-open	New
Scheduled	Schedule Config	Set frequency, timezone, per-question rerun behavior	New
Connect	Database Connector	Connect to 6 database types with TLS support	Live
Connect	Catalog & Allowlist	Auto-discover schemas, manage table permissions	Live
Config	Metric Library	Define reusable business metric definitions	Live
Config	Business Context	Org-wide context for AI understanding	Live
Usage	Usage Dashboard	LLM tokens, queries, reports, cost tracking	Live

Content & Branding Guidelines

Essential checklist for the marketing team when creating content, campaigns, and brand assets for Project Overload v2.

Brand Positioning & Messaging

- ☐ **Lead with the outcome, not the technology.** Users don't care about "multi-LLM pipelines" — they care about getting executive reports in 15 minutes instead of 2 weeks. Always lead with business value.
- ☐ **Use the "Define Once, Run Forever" tagline.** This is the core differentiator. Report Contracts are the hero concept — emphasize the shift from manual, repetitive reporting to automated delivery.
- ☐ **"Zero SQL Required" is a primary hook.** Emphasize the conversational interface. Show before/after: SQL query vs. plain English question producing the same report.
- ☐ **Position as "AI Analyst, Not AI Dashboard."** We don't just show charts — we analyze, explain why, and recommend what to do. The executive brief format (What/Why/So What/Actions) is the differentiator.
- ☐ **Emphasize trust and governance.** In the AI era, trust matters. Lead with: evidence-based (no hallucination), read-only access, table allowlists, audit trail, 90% confidence threshold. These are enterprise selling points.

Content Strategy

- ☐ **Create persona-specific landing pages.** Build separate messaging for: (1) Executives who want automated reports, (2) Analysts who want to escape report drudgery, (3) Data engineers who want governed self-serve, (4) Department heads who want independence from IT.
- ☐ **Showcase the Scheduled Reports feature prominently.** This is the newest and most differentiating capability. Create a dedicated feature page, demo video, and announcement blog post. Highlight the "set it and forget it" angle.
- ☐ **Build a "Time to First Report" narrative.** Create content showing the journey: connect database → have a conversation → get a report → schedule it. Emphasize the speed (minutes, not weeks). Video walkthroughs are ideal.

☐ **Develop comparison content vs. traditional BI tools.** Use the differentiators table in this document. Create blog posts, infographics, and social content around: "Tableau vs. Project Overload" or "Why your dashboards aren't enough."

☐ **Produce use case templates.** Create ready-made report templates for common scenarios: CEO Weekly Dashboard, Monthly Revenue Report, Quarterly Business Review, Customer Churn Analysis, Marketing ROI Tracker, Sales Pipeline Health.

Content & Branding Guidelines

Visual Identity & Design

- ☐ **Use the dark, premium aesthetic.** The product has a dark UI with purple/violet accents. Marketing materials should mirror this: dark backgrounds (#0F0B1A), purple gradients (#6C3AED to #EC4899), and clean typography.
- ☐ **Show the conversation, not the dashboard.** Hero images should feature the chat interface, not traditional BI charts. The conversation IS the product — make it the visual centerpiece.
- ☐ **Visualize the pipeline.** The 6-stage pipeline (Chat → Strategy → Execute → Analyze → Compose → PDF) is visually compelling. Use it in diagrams, animations, and explainer content.
- ☐ **Create before/after comparisons.** Side-by-side visuals: messy spreadsheet vs. polished executive PDF. Raw SQL vs. natural language question. Manual weekly rebuild vs. automated delivery notification.
- ☐ **Design social-ready report snippets.** Take real (anonymized) report sections and turn them into shareable graphics. The executive brief format is visually distinctive — use it.

Messaging Pitfalls to Avoid

- ☐ **Don't call it a "chatbot."** It's an AI-powered business intelligence platform. "Chatbot" undersells the analytical depth. Use: "conversational analytics," "AI analyst," or "report automation platform."
- ☐ **Don't over-promise on AI accuracy.** We have guardrails (90% confidence filter, evidence-based analysis), but never claim "100% accurate." Messaging should emphasize: "evidence-backed," "auditable," "transparent reasoning."
- ☐ **Don't ignore the human-in-the-loop.** The scope confirmation step and approval workflow are features, not limitations. Emphasize: "You stay in control. The AI proposes, you approve."
- ☐ **Don't hide the LLM dependency.** Be transparent that reports are AI-generated via Claude. In 2026, AI transparency is a trust signal, not a weakness. Mention the model by name.
- ☐ **Don't position as a replacement for data teams.** Position as a force multiplier: "Give your data team superpowers" not "Fire your data team." Enable self-serve for stakeholders while freeing analysts for higher-value work.

☐ **Don't lead with database count.** "Supports 6 databases" is a checkbox feature. Instead, lead with: "Connects to the database you already use" — make it feel effortless, not spec-sheet.

Go-to-Market Readiness

Tactical checklist for the marketing team to prepare for launch and ongoing content production.

Pre-Launch Essentials

- ☐ **Product walkthrough video** (3–5 min) showing the full journey: connect → chat → report → schedule. Record screen capture with voiceover.
- ☐ **Feature announcement for Scheduled Reports.** Blog post + social campaign highlighting the new automation hub, run history, and smart rerun behavior.
- ☐ **Landing page with clear CTAs.** "Try Your First Report" as primary action. Show the conversation UI above the fold. Include social proof and comparison table.
- ☐ **Documentation and help center.** User guides for: connecting databases, creating first report, setting up schedules, managing metric definitions, understanding insight modes.
- ☐ **Sample report gallery.** 5–8 anonymized sample reports showing different use cases: revenue analysis, customer health, product usage, operational metrics, data quality audit.

Ongoing Content Pipeline

- ☐ **Weekly "Report of the Week" social series.** Showcase interesting report use cases. Rotate through personas (CEO, Sales Lead, Marketing, Ops).
- ☐ **"From Question to Report" blog series.** Real-world scenarios: "How a CFO automated their monthly board report" or "How ops eliminated their weekly metrics spreadsheet."
- ☐ **Integration spotlight content.** One piece per supported database: "Project Overload + Snowflake," "Project Overload + Supabase," etc. Highlight database-specific strengths.
- ☐ **Security & governance deep-dive.** Whitepaper or blog post detailing the full security model: SQL Guard, read-only enforcement, allowlists, audit logging, evidence hashing. Target data engineering and InfoSec audiences.
- ☐ **Competitive comparison pages.** SEO-targeted pages: "Project Overload vs Metabase," "Project Overload vs Looker," "Project Overload vs ChatGPT for analytics." Honest, differentiated

Key Phrases & Copy Bank

Hero Copy

"Your AI data analyst that never sleeps. Define a report in conversation. Get it automatically, every week."

Sub-Hero

"From raw database to executive PDF in one conversation. No SQL. No dashboards. Just insights."

Scheduled Reports

"Set it and forget it. Lock your business logic into a report contract and let the AI handle the rest — weekly, monthly, or quarterly."

Trust / Security

"Every insight backed by evidence. Every query audited. Every table allowlisted. AI analytics you can trust."

• END OF DOCUMENT

Project Overload

VERSION 2.0

AI-powered business intelligence.
Conversational. Automated. Trustworthy.
