

Define the report once. Run it forever.

A governed AI reporting system that turns one scoped chat into a reusable reporting contract, recurring executive output, and follow-up decision support.

Governed SQL

Recurring reports

Executive-ready output

Claritect combines governed data access, scoped analytical chat, HTML and PDF reporting, report clarification, business case follow-up, and deterministic scheduling in one operator surface.

THE PROBLEM

Reporting breaks because the workflow is fragmented.

Teams do not just need answers. They need repeatable, trusted, business-readable reporting.

01

Analysts rewrite the same logic every week

Date windows, joins, and filters get rebuilt instead of reused.

02

Chat outputs are often one-off and non-operational

A good answer today does not become a dependable reporting system tomorrow.

03

Governance and readability pull in opposite directions

Teams either get raw SQL with risk or pretty output with weak trust.

What buyers actually want

- A governed way to connect to production data.
- A way to scope the report once without repeating clarifications.
- Business-ready output that leadership can actually use.
- A repeatable schedule that rolls forward safely.
- Follow-up analysis without losing context.

THE PRODUCT

Claritect turns one analytical chat into a reusable report contract.

The system captures not just the question, but the governed logic, assumptions, and rerun behavior needed to operate the report over time.

Connect a governed source

Guide the user through source, governance, cataloging, and activation across Postgres, MySQL, Snowflake, and BigQuery.

Scope once in chat

Break the report into atomic questions, ask clarifications, suggest useful follow-ups, and lock the final plan.

Run, explain, and schedule

Generate the report, answer questions on it, build business cases, and save it as a recurring schedule.

System of record: report contract

Primary output: HTML + PDF report

Recurring value: deterministic scheduled reruns

OPERATOR FLOW

The workflow moves from source connection to recurring intelligence.

Every major step is explicit, governed, and persisted.

THE CONTRACT

The report contract is what makes the system reusable.

Claritect persists the structure of the report, not just a single answer.

Saved in the contract

- Report title, audience, and timezone
- Scoped questions and clarification answers
- Metric definitions and business context
- Guardrails such as allowlisted relations and schemas
- Prepared query overrides after operator SQL edits
- KPI watchlists and schedule state when the report becomes recurring

Why this matters

Most analytics tools persist charts. Most chat tools persist transcripts. Claritect persists an operational reporting contract that can be rerun, audited, and evolved.

One scoped conversation becomes a repeatable operating asset.

Judgment and governance are deliberately split.

AI handles reasoning where nuance matters. Deterministic code handles risk where trust matters.

AI-powered layers

- Conversation orchestration and scoping
- Batch analysis and forecast analysis
- Report composition
- Report clarification
- Business case generation

Deterministic layers

- SELECT-only SQL enforcement
- Allowlist and schema checks
- Forced limits and evidence row cap
- Cron plus timezone scheduling
- Queueing, retries, and audit logging

Read-only customer access

Evidence row cap ≤ 200

Deterministic scheduling

Business-consumable output

OUTPUTS

The report is not the end of the flow. It becomes a decision surface.

Every completed run can immediately support operator follow-up.

HTML + PDF report

Customer-facing narrative output with structured sections, charts and tables, and metric-definition support.

Ask clarifications on the report

Grounded follow-up answers using report HTML, exec brief, prepared payloads, summaries, and metric definitions.

Ask for business case analysis

Detailed scenario and business case work only for genuinely actionable recommendations from the run.

Same context stays available after generation.

Same chat remains the working thread.

Same run can be reopened later from Scheduled Reports.

Recurring runs are more than cron jobs.

Claritect stores enough context to rerun the report as a stable product experience, not a fragile script.

Saved with the schedule

- Frequency, timezone, and cron
- Question-by-question rerun behavior
- Windowing instructions
- Query template snapshot
- HTML template snapshot

What happens on the next run

- Time windows roll forward to the next reporting period.
- The query strategist can reuse saved query patterns.
- The composer can reuse the previous HTML structure.
- A change-checker layer adds what-changed notes versus the last run.

WHY IT WINS

Claritect sits between dashboards and one-off AI chat.

It combines repeatability, governance, and executive-ready output in one operating model.

	Traditional BI	One-off AI chat	Claritect
Governed source access	Partial	Inconsistent	Built in
Atomic scoped questions	Manual setup	Ad hoc	Built in
Business-readable report output	Usually manual	Variable	Built in
Repeatable schedules	Possible but brittle	Weak	Deterministic
Report Q&A after generation	Rare	Context loss	Built in
Business case follow-up	Separate workstream	Ungrounded	Built in

CLOSING

Claritect turns reporting into a governed recurring system.

From first connection to scheduled rerun, the product is built to move from exploratory analysis to repeatable operating output.

Trusted by governance. Read-only, SELECT-only, allowlisted, auditable.

Useful to operators. Query preview, query editing, report clarification, business case follow-up.

Useful to leadership. Narrative HTML and PDF output plus recurring scheduled delivery.

Claritect

From raw tables to recurring intelligence.
